YT-269-1B

Single-Needle Lockstitch Free-arm Flatbed Industrial sewing machine For Medium-weight Applications (For binding use)

SPECIFICATION:

- The model YT-269-1B is specialized in binding attachments for industrial sewing applications, particularly its synchronized binder feed machines which are equipped with a special mechanism that oscillates the binder with the movement of the feed dog and the walking (front) presser foot.
- The binder is mounted very closely to the front presser foot and the needle, and its movement is "synchronized" perfectly throughout the sewing cycle.
- Since the needle is so close to the binder, the binding is sewn down immediately after it leaves the mouth of the binder.
- This allows the machine to easily sew around a very small radius and prevents the binding from "dropping off" the work, which is a frequent problem in binding operations where a standard (non-synchronized) binder is used.
- Binders can be very specialized, but there are 3 basic types; right angle, in line and C type.

Model	YT-269-1B
Presser Height(mm) By hand/By Pedal	13.0MM
SPEED	1600 S.P.M.
MAX. STITCH LENGTH	10MM
NEEDLE SYSTEM	DP X 17(134-135)
STROKE	34
Vertical hook
